

Instructions for sperm search test:

You need to come to the test with 17 days of abstinence.

On the day of the test you should produce two semen samples for the test (if it is possible). You can wait for an hour between the two. We recommend taking from our lab few days before the test, two tubes with medium that preserves the semen. Then you produce the semen where you stay, put the medium on each semen sample and come to the lab with the two samples. Another option is to produce the two samples in the lab.

Before you produce the first sample, you need to wash yourself well and get dry with a clean towel.

If you want us to freeze the semen sample (in case we find motile sperm cells), you must come with updated blood tests for Hepatitis B (HBS Ag), Hepatitis C and HIV.
